

Prototype

1. Write a constructor function to represent a Rectangle, which can calculate its area and perimeter.
2. Write a Point function which takes x and y coordinates as arguments to define it. It should also be able to evaluate the distance from another point. (We will use this in DOM later)
3. Write javascript code so that we can check if a string object is a palindrome. E.g. "xyx".isPalindrome() should return true.
